

From Page No. _____

- used Max efficiency DH5 α ~~KL3~~ 101 & transform
- control puc 5 μ l = 50 pg } + 100 μ l of Competent
- 5 μ l of each U3G Rx }

$\begin{matrix} 30' & 4' \\ 45' & 42' \\ 2' & 4' \end{matrix}$
- add 900 μ l of ^{50c}competent cells and let
to express for 1 hr.
- plated control - diluted 1:10 20, 50, 100 μ l

Test - un " 20, 50 & 100 μ l
- 100 μ l from each plated x 2
- 12/6/94
- Agouti counted them all. Amp - depletion resulting in
- lab of satellite colonies - no
to score.
- According to Agouti in Mon treated the counts were 50 =
- Test not much difference between balanced & ~~input~~ into
reaction, ~~and~~ still more whites than (normal) earl
this of mine.
- 10 fold increase in the present set of plates
= 10% whites.
- plated a few more from each reaction for better
accurate count. These plates were treated with 50 pg
of fresh Ampicillin.
- prepared in cont of 100 mg/ml.

2.5

- Agents did another reaction with Tag, different cycles & and 2 dif len of target template, 5 pg and 50 pg with du primers & pvc

- # cycles: 10, 20, 35 & 40

- with 10 cycles no product in both len of target

with 20 cycles, 5 pg target barely visible product 50 pg gave a faint amount which was quite visible

both 5 & 50 pg, quite a good amount of product yield with 35 & 40 cycles. With 50 pg more than 5 pg & 40 cycles more than 35 cycles as expected.

Did transformation of all the products, more amp spread out 500 µl final.

All with Tag.

Results: Colony & low

even at 35 & 40 cycles. But

high % of colonies unexpectedly high even at lower # of cycles??

np: no problem - even in BPP plates satellite colonies with Rx & not with control something to do with the restriction + transformation

swirl yield did not correspond to % of colonies obtained? correlation between # of cycles and % of carriers??
